

Environmental Policy

WTB Control imports, stocks, sells, and distributes industrial components within hydraulics. We also design and produce systems in this field.

With the environmental policy, we express our commitment to taking our share of responsibility for improving the environment and contributing to sustainable development. Circular thinking and conservation of natural resources are key principles in our business operations.

Environmental work should be conducted within the framework of our business mission and be well-integrated into our operational activities. By maintaining high competence among our employees and continuously developing our understanding of environmental impacts, we can have a comprehensive view of environmental issues.

Environmental measures should be taken as far as technically possible, economically reasonable, and environmentally justified.

In practical terms, this involves:

- Minimizing the generation of waste and preventing the risk of emissions.
- Considering environmental performance in the selection of products and transportation methods, as well as in the design of processes and services.
- Continuously influencing employees and suppliers to engage in open and committed environmental work.
- Conducting environmental work aimed at continuous improvements, where compliance with applicable laws and other binding requirements represents the minimum standard for our operations.

The environmental policy is communicated within the organization through the intranet and during internal meetings and conferences. All employees are responsible for being aware of, understanding, applying, and developing the policy.
